Work trips: -37%

Non-Work: +4%

1. While the survey data from all observation years was processed at the same time in a consistent manner to support this effort, some of the observed differences could be attributable to variations in the survey instrument or methodologies for any given year.

2. The survey reflects household level person travel and the sample is expanded to the survey year population. The mode share observations could be influenced by this expansion process.

3. The observed travel trends show a similar trajectory to those trends observed in the National Household Travel Survey.
